

BIOSCIENCE INTRODUCES  
NEW CLARIFYING FORMULA

BETHLEHEM, PA (April 2, 2002) – Bioscience, Inc. has introduced a new biological product for maintaining water clarity of lakes, fish farms, lagoons, polishing ponds and other slow-moving bodies of water.

Known as MICROCAT®-AL, the new formulation includes naturally-occurring microorganisms selected for their ability to reduce suspended solids in slow-moving water and to improve water clarity. Both aerobic and facultative anaerobic species are included to improve settling under either high or low dissolved oxygen conditions. The product also contains biodegradable flocculant aids.

A company spokesman said that the product is an extension of Bioscience microbial biotechnology widely used in wastewater treatment to out-compete common microorganisms that cause high effluent discharge suspended solids, without the use of toxic chemicals.

MICROCAT-AL, a granular powder, is applied directly to the body of water on a daily basis. For preventive maintenance, approximately one/half pound of product is used per acre-foot for reduction of suspended solids.
