

NEW PRODUCT FOR ALGAE CONTROL
OFFERED BY BIOSCIENCE, INC.

BETHLEHEM, PA (September 1, 2000) – A new product for algae control in slow-moving, shallow water bodies has been introduced by Bioscience, Inc. Called MICROCAT®-AL, it is a blend of microorganisms selected from nature for their ability to compete with algae for nutrients, plus flocculant aids to prompt settling of algae and other solids.

MICROCAT-AL is intended for wastewater treatment systems handling municipal, commercial, fish farming, industrial and food processing wastes, where effluent quality may be hard to achieve because of excess suspended solids caused by algae blooms. Algae is a particular problem when lagoons and other shallow water bodies heat up during summer months, especially in warm, sunny climates.

MICROCAT-AL is a granular powder which is applied directly to the water. It is effective at temperature ranges from 10 to 40 degrees C. In addition to aerobic microorganisms it contains facultative anaerobes for activity in stagnant bodies of water such as ponds and lakes.
